

Our module will be responsible for creating the agents within our world. With the vision of our world being a civilization builder, we plan for our agents to serve as the troops and civilians for the user's world. With a set of pre-defined behaviors, our agents will be in charge of replenishing resources, setting up defenses, attacking adversaries, exploring the unknown world, and building up the user's civilization. Our agents would possibly represent mass troops similar to a platoon or a group of village folk, and they would rely on the command of AI agents to know when they should leave the base to collect more resources or go to attack hostiles. Over the duration of the game, our agents will collect statistics of actions they did that game, such as battles won or lost, amount of resources collected, or buildings built. These stats would then be forwarded to the data analytics group for them to digest and present to the user. These statistics collected by our agents, will be useful for the user to learn strategy over time for our civilization builder game.
